

4/26/90

Gary -

just a note on a few items -

- ① - Valve adjustment .002 Cold INT & EXH
- ② - oil Pressure - 60 PSI @ 3000 RPM at 70°
- ③ - coolant temp - normally 75-85°C
Thermostat may need changing -
use a Chevrolet 180°
- ④ - Clean the Accusump System out
before installing. you never know
what might be inside it. Then
after installing it, check oil level.
- ⑤ Plugs - NGK C6HSA HOT
C7HSA COLD

you will probably never need C7HSA plugs
if plugs foul, replace immediately.

- ⑥ - change oil at 500-1000 Miles. Keep
revs 4000 or less for first 500 miles

Max revs when run in 5000 RPM. you
can go to 5500/5750 but not
advisable as engine life becomes
very short.

If you have any questions or problems, Please
call me.

Thanks
Mike

Let's try & coincide the head retorque at 500-1000 miles
